                      similarity).
SUBCELLULAR LOCATION: Secreted; extracellular matrix.
FYM: The attached glycosaminoglycan chain can be eith
chondroitin sulfate or dermatan sulfate depending upo
of origin (By similarity).
SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOG
(SLRP) FAMILY. CLASS I SUBFAMILY.
SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

-!- PTM: The two attached glycosaminoglycan chains can be enchondroitin sulfate or dermatan sulfate (By similarity)
-!- SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLY.

(SLRP) FAMILY. CLASS I SUBFAMILY.
-!- SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

The N-linked glycan at Asp-281 is composed of variable structures of GlcNAc, mannose, fucose, HexNAc and hexose. POLYMORPHISM: The poly-Asp region of ASPN is polymorphic and ranges at least from 11 to 17 Asp. SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN (SLRP) FAMILY. CLASS I SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cartilage, aorta, uterus. Moderate expression in small intestine, heart, liver, bladder, ovary, stomach, and in the adrenal, thyroid, and mammary glands. Low expression in trachea, bone marrow, and lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Secreted; extracellular matrix. Also detected in the thoracic body wall adjacent to the heart. At 13.5 dpc, it is detected in the mesenchyme lateral to Meckel's cartilage. Pronounced expression is observed in the perichondrium of the humerus, ribs, and scapula. At 14.5 dpc, it is detected in the mesenchymal condensations lateral to Meckel's cartilage, in the perichondrium surrounding the central cartilaginous elements of the vertebra and also in the dermal mesenchyme. At 15.5 dpc, it is expressed in the perichondrium/periosteum of the long bones (i.e femur, tibia, and fibula), some of the flat bones at the base of the skull (i.e sphenoid bone), ribs, clavicle, and vertebrae. Also detected in the intramembranous bones of the maxilla and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mandible (alveolar bone) and a strong expression is observed in sagittal sections of the subcutaneous muscles or panniculus carnosus of the thorax, trunk, and head/ neck (platysma muscle) region. Very little expression is detected in the major parenchymal organs (with the exception of the large bronchi of the lung). Its expression is prominent in the developing mouse skeleton, particularly in the perichondrium/periosteum of cartilage/bone, and is also found in other specialized connective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH (SLRP) FAMILY. DOMAIN: The basic amino-terminal Arg/Pro-rich binds hepari. heparan sulfate. Binds collagens type I and type II throug leucine-rich repeat domain (By similarity). SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (SLRP) FAMILY. CLASS II SUBFAMILY.
SIMILARITY: Contains 12 leucine-rich (LRR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    similarity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: Binds the basement membrane heparan perlecan and triple helical collagens type I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AF163569; AAG23724.1; -.

                                                                         SUBUNIT: Binds the basement membrane heparan sulfate proteoglycan perlecan and triple helical collagens type I and type II.

SUBCELLULAR LOCATION: Secreted; extracellular matrix.

DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin and heparan sulfate. Binds collagens type I and type II through its leucine-rich repeat domain.

SIMILARITY: BELONGS TO THE SWALL LEUCINE-RICH PROTEOGLYCAN (SLRP) FAMILY. CLASS II SUBFAMILY.

SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

Nishiu J., Tanaka T., Nakamura Y.,
"Identification of a novel gene (ECM2) encoding a putative
extracellular matrix protein expressed predominantly in adipose and
femmale-specific tissues and its chromosomal localization to 9q22.3
Genomics 52:378-381(1998).

-i- SUBCELLULAR LOCATION: Secreted; extracellular matrix.
-i- TISSUE SPECIFICITY: Expressed predominantly in adipose tissue
-i- TISSUE SPECIFICITY: Expressed predominantly in adipose tissue

In adult, highest expression in lung, lower levels in cardiac and skeletal muse DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin heparan sulfate. Binds collagens type I and type II through leucine-rich repeat domain (By similarity).

SIMILARITY: BELONGS TO THE SWALL LEUCINE-RICH PROTEOGLYCAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         perlecan and triple helical collagens type I and type similarity).
SUBCELLULAR LOCATION: Secreted; extracellular matrix.
TISSUB SPECIFICITY: Expressed in cartilage throughout

In the adult cartilage lumican exists predominantly in a glycoprotein form lacking keratan sulfate, whereas the juvenile form of the molecule is a proteoglycan. SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCAN

The resulting fusion proteins were useful for inhibiting the activity cacell regulatory factor, esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such

NTTAs are antigens (whole antigens or fragments)
continvolved in autoimmunity. These peptides and proteins are used in
the method of the invention which involves administering an NTTA as an
antigen based immunotherapeutic agent, to a host afflicted with an
autoimmune response associated with an autoimmune disease. The
immunotherapeutic agent is used to treat autoimmune diseases such as
insulin dependent diabetes mellitus, multiple sclerosis, autoimmune
thyroiditis, uveoretinitis, rheumatoid arthritis or abnormal
inflammatory immune responses. The NTTA induces regulatory tolerance by
elicitation of regulatory T cells among T cells recognizing the NTTA but
not participating in the immune response . The NTTA are capable of
recognition by substantial populations of uncommitted T cells which can
be primed, or biased, towards regulatory responses to provide effective
treatment. The NTTA are effective in regulating undesirable immune

Novel central nervous system protein #196.

05-JUN-2002

(first entry)

```
The invention relates to the inhibition of transforming growth CC factor-beta (TGF-beta) activity involving contacting TGF-beta with a CC purified polypeptide comprising leucine-rich amino acid sequence of a CC member of decorin superfamily of mammalian proteoglycans. The following CC activities can be attributed to the polypeptide of the invention: CC cytostatic, nephrotropic, antirheumatic, antiarthritic, vasotropic, CC antiarteriosclerotic, hepatotropic, cardiant, dermatological and CC vulnerary. Polypeptides of the invention act as transforming growth CC factor-beta (TGF-beta) binder. The polypeptides of the invention can be CC used for treating a pathology, particularly proliferative pathology caused by a transforming growth factor-beta (TGF-beta) regulated CC clisease, glomerulonephritis, rheumatoid arthritis, arteriosclerosis, attributory distress syndrome, carrhosis of liver, fibrosis of lungs, post-myocardial infarction, cardiac fibrosis, post-angioplasty crestenosis, renal interstitial fibrosis and certain dermal fibrotic conditions such as keloids and scarring resulting from burn injuries; other invasive skin injuries and reconstructive surgery. The wounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-NOV-1991;

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. coronal infection, gastrointestinal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system
                                                                                                                                                                                                                                                            WPI; 200
N-PSDB;
                                                                                                                                                                                                     New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used food additives or preservatives -
                                                                                                                                                                             Claim

The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AART16517) coding f the fusion. The decorin binds to type I collagen and thus affects Elbril formation.—It Thibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue.

standard;

Protein;

decorin;

chimera.

```
The specification describes a method for producing an extracellular comatrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; corporating the nucleic acid sequence into the cell; and contacting contact acid, selected from the group consisting of trans-4-hydroxyproline and contacting containing at least one amino cacid, selected from the group consisting of trans-4-hydroxyproline and contacting containing at least one amino cacid, selected into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and contactine into proteins. This is especially useful in the recombinant production of proteins. This is especially containing and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxypation of proteins trans-4-hydroxyproline. The method is also useful in studying the structure and function of proteins which do not normally contain trans-4-hydroxyproline.

The present sequence represents a chimeric collagen 1 (alpha1)/decorin
                                                                                                                                                                                                                                                                       Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants -
                                                                                                                                                                                                                                               Claim 25; Fig 17A-B; 260pp; English.
